Một ví dụ đơn giản của Redux 🥳

```javascript
import { createStore } from 'redux'

// Step 1: Define a reducer
// A pure js function
// that transform the old state to the new one
// based on the action.type
function counter(state = 0, action) {
  switch (action.type) {
    case 'INCREMENT':
      return state + 1
    case 'DECREMENT':
      return state - 1
    default:
      return state
  }
}

// Step 2: Init your store with the reducer
// Its API is { subscribe, dispatch, getState }.
let store = createStore(counter)

// Step 3: Subscribe to state changes to update UI
store.subscribe(() => console.log(store.getState()))

// Step 4: Dispatch action to update redux state
// The only way to mutate the internal state is to dispatch an action.
store.dispatch({ type: 'INCREMENT' }) // 1
store.dispatch({ type: 'INCREMENT' }) // 2
store.dispatch({ type: 'DECREMENT' }) // 1
```
